My story ...

Machine  
Learning

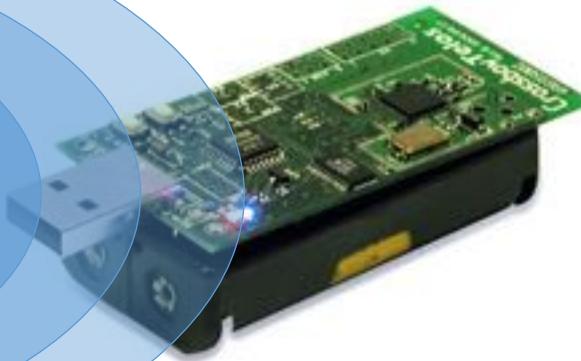

Learning  
Systems

# Back in 2007

# Back in 2007

I started studying the use of  
**Gaussian Process (GP)** models  
for wireless link quality  
estimation

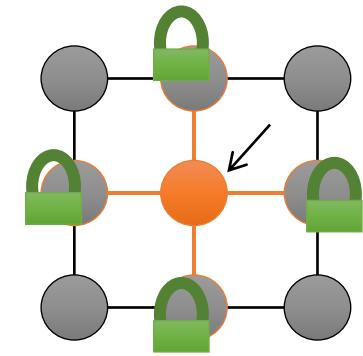

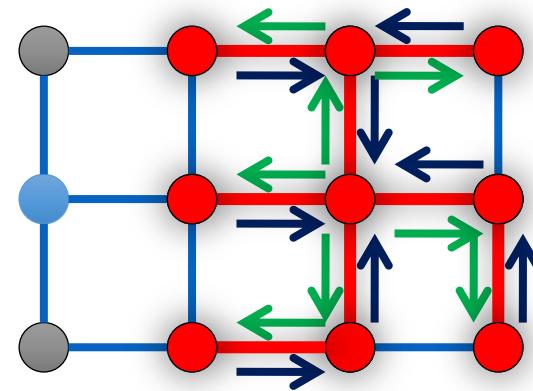

Research was slowed by the speed of training  
... and the fact that link quality is difficult to predict

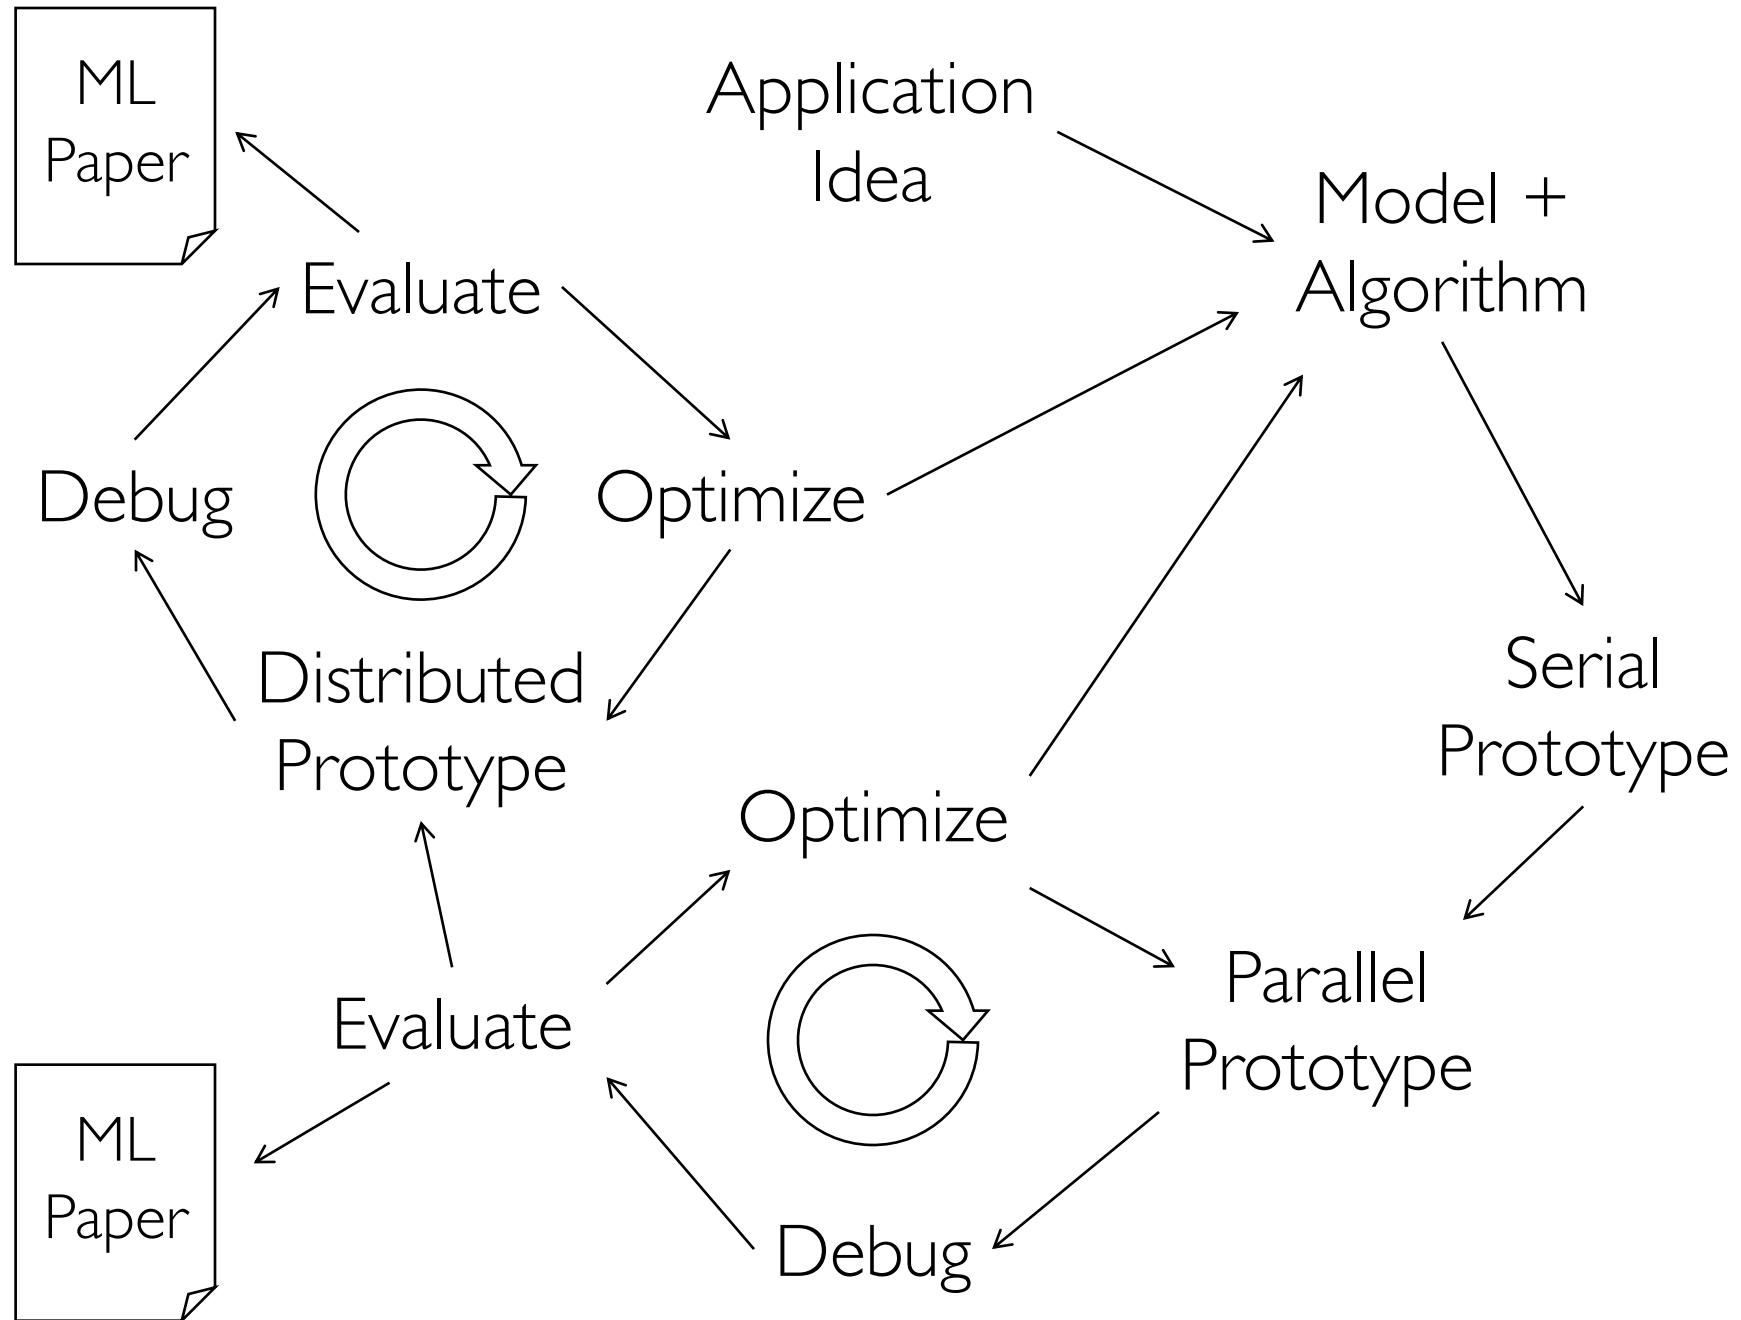

# Back in 2008

I started studying parallel  
inference algorithms and  
systems

I designed and implemented parallel learning algorithms on top of  
low-level primitives ...

# Low-Level Primitives

- Shared Memory Parallelism: *pThreads & OpenMP*
- Distributed Communication: *Actors & MPI*
  - Yes,... I built an RPC framework and then an actor framework
- Hardware APIs + Languages: *GPU Programming (CUDA)*

Low-level parallel primitives offer  
fine grained control over parallel execution.

# Advantages of the Low-Level Approach

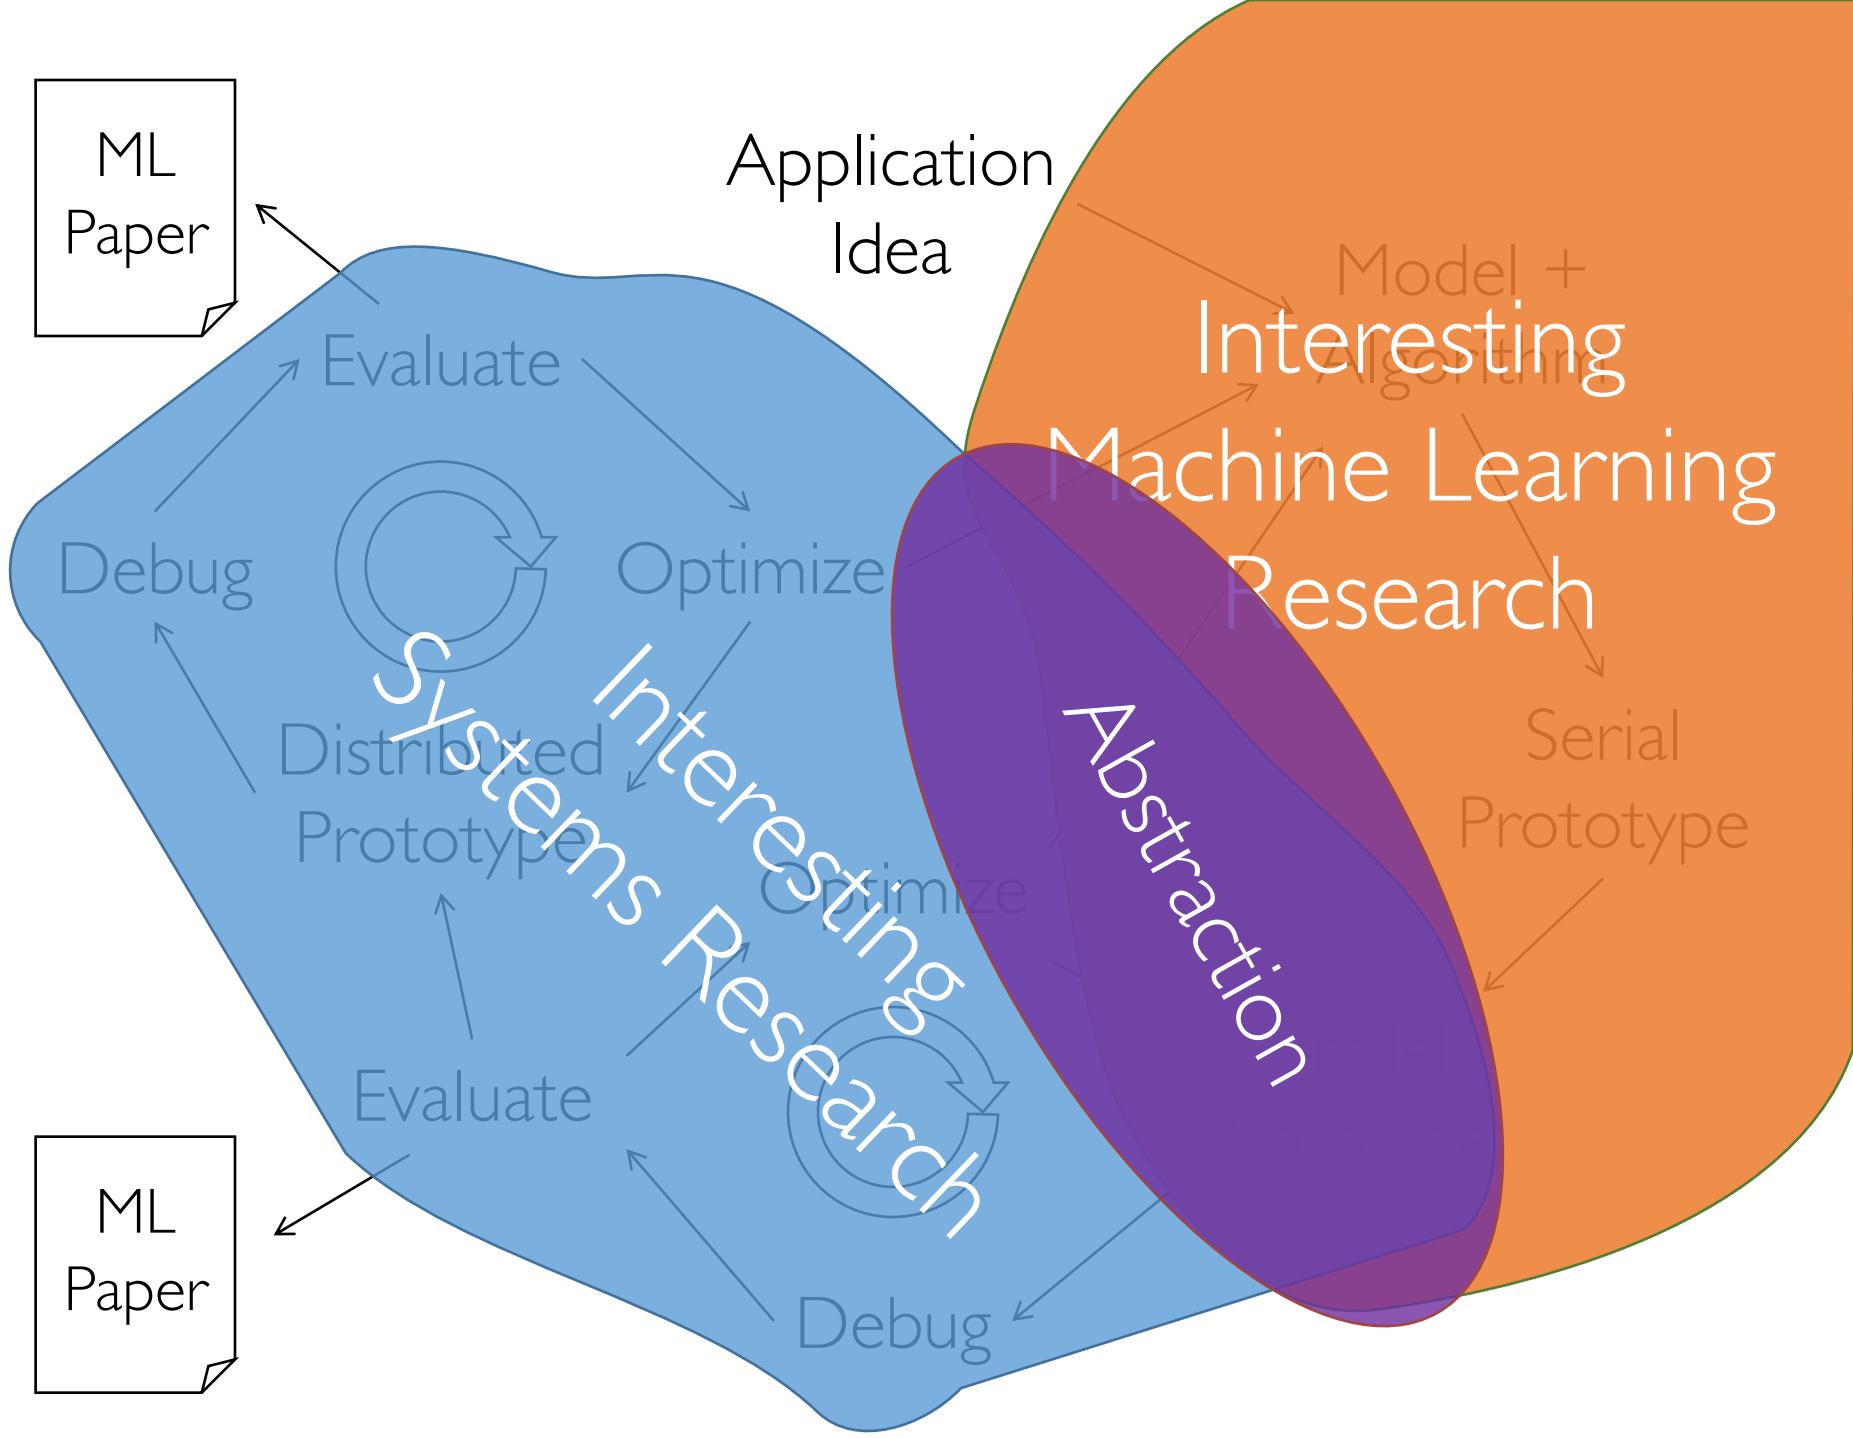

- Extract maximum performance from hardware
- Enable exploration of more complex algorithms
  - Fine grained locking
  - Atomic data-structures
  - Distributed coordination protocols

*My implementation is better than your implementation.*

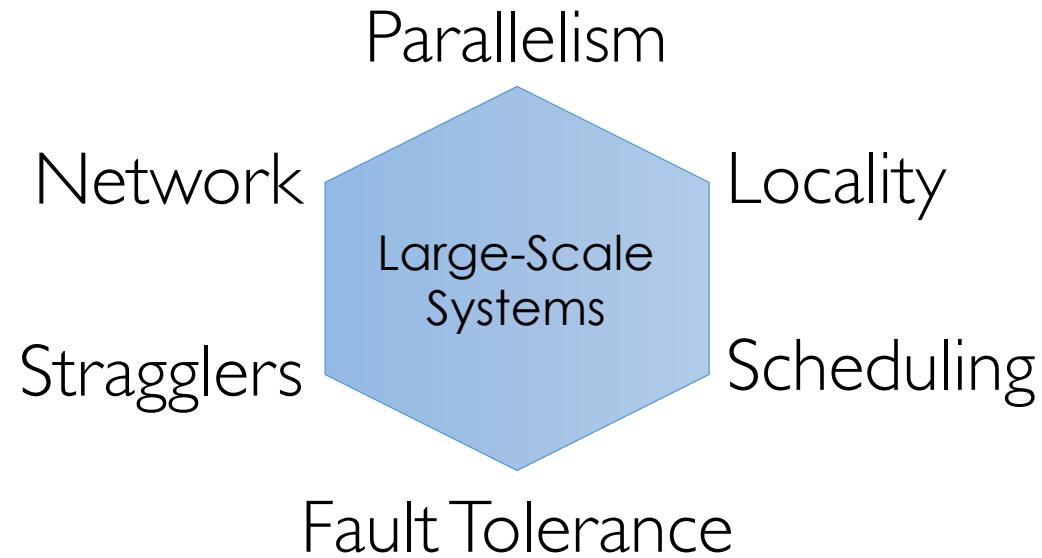

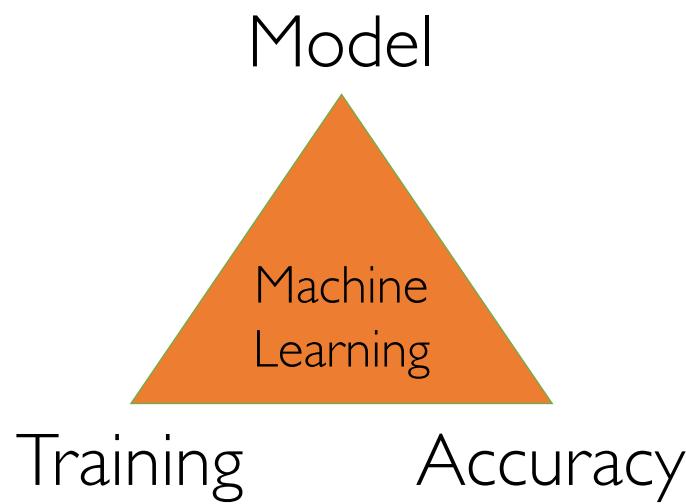

# Limitations of the Low-Level Approach

- Repeatedly address the **same system challenges**
- Algorithm conflates **learning** and **system logic**
- Difficult to **debug** and **extend**
- Typically does not address issues at scale: **hardware failure, stragglers, ...**

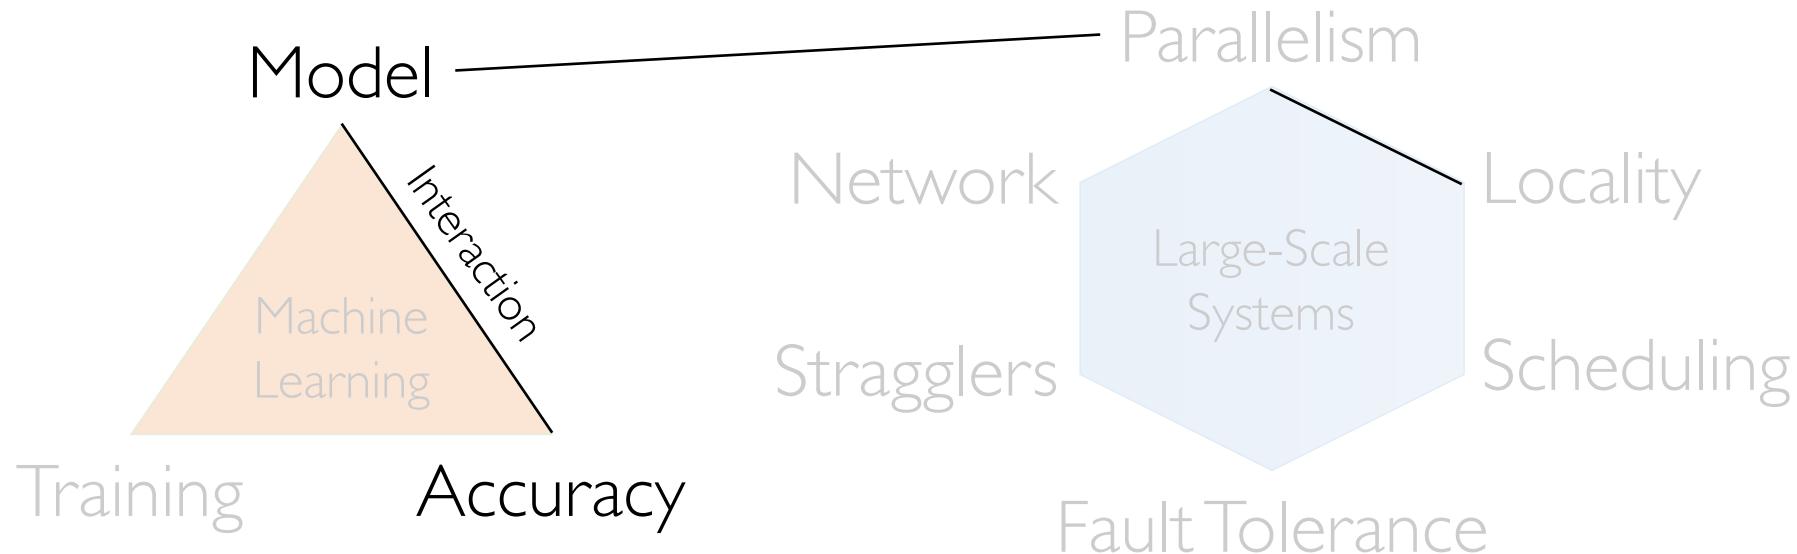

*Months of tuning and engineering  
for one problem.*

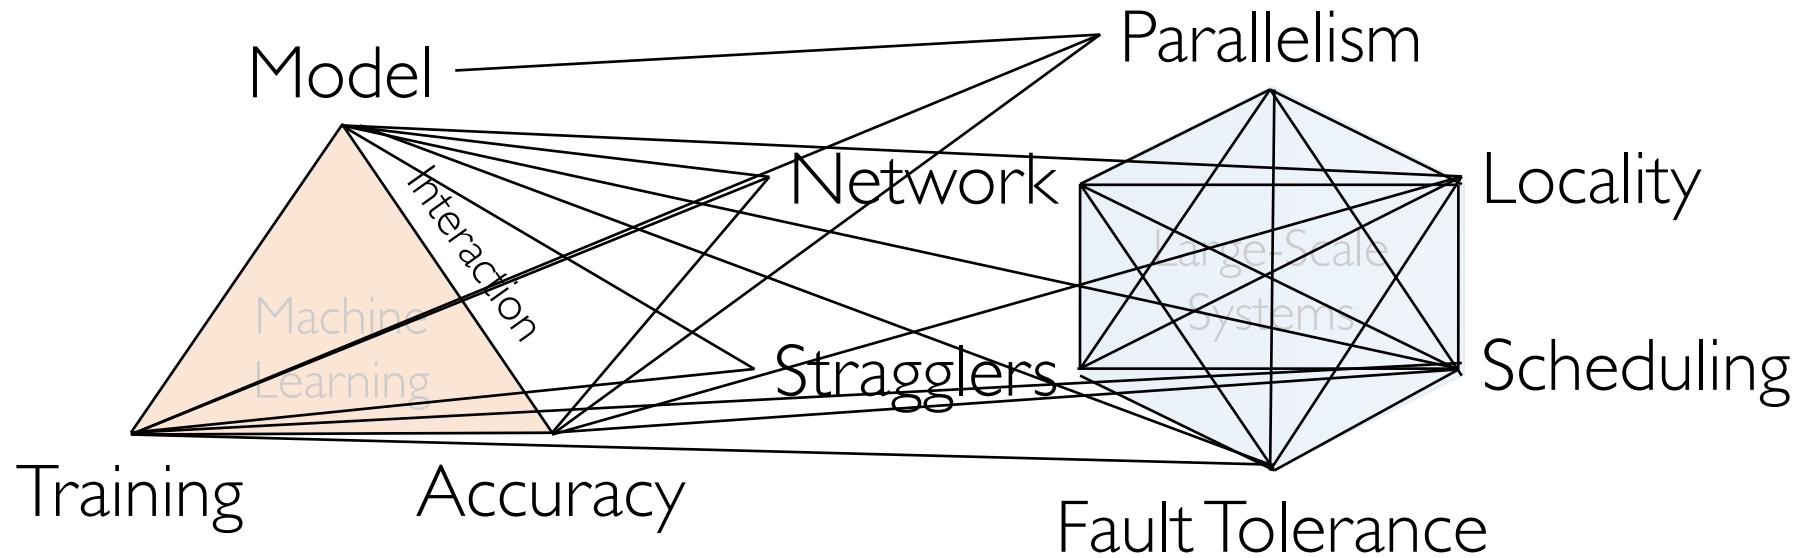

# Design Complexity

# Design Complexity

# Design Complexity

Learning systems combine the complexities  
of machine learning with system design

# Managing Complexity Through Abstraction

Identify common patterns  
Define a narrow interface  
Exploit limited abstraction to address system design challenges

Learning Algorithm  
Common Patterns

Abstraction (API)

System

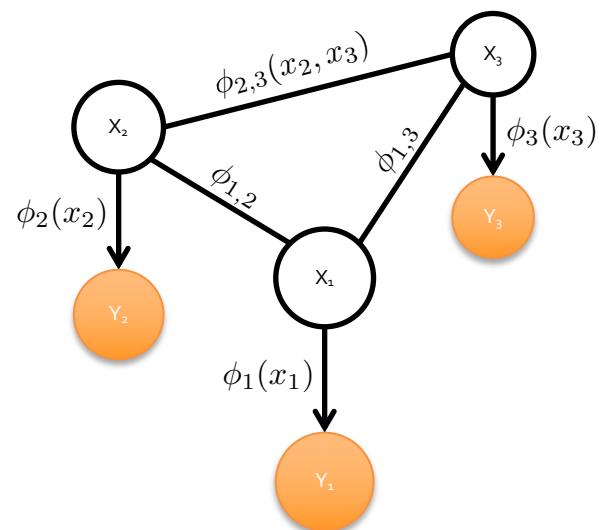

- 1. Parallelism
- 2. Data Locality
- 3. Network
- 4. Scheduling
- 5. Fault-tolerance
- 6. Stragglers

Overview

The ML Systems Workshop will be held as part of ICML in NYC on June 24, 2016, 8:30am

Location

Microsoft Technology Center  
(11 Times Square, 8th avenue between 41st and 42nd streets)  
Room Central Park on 6th Floor  
Entrance at the intersection of 8th avenue and 41st street  
Phone: 212-245-2100

Map/Directions

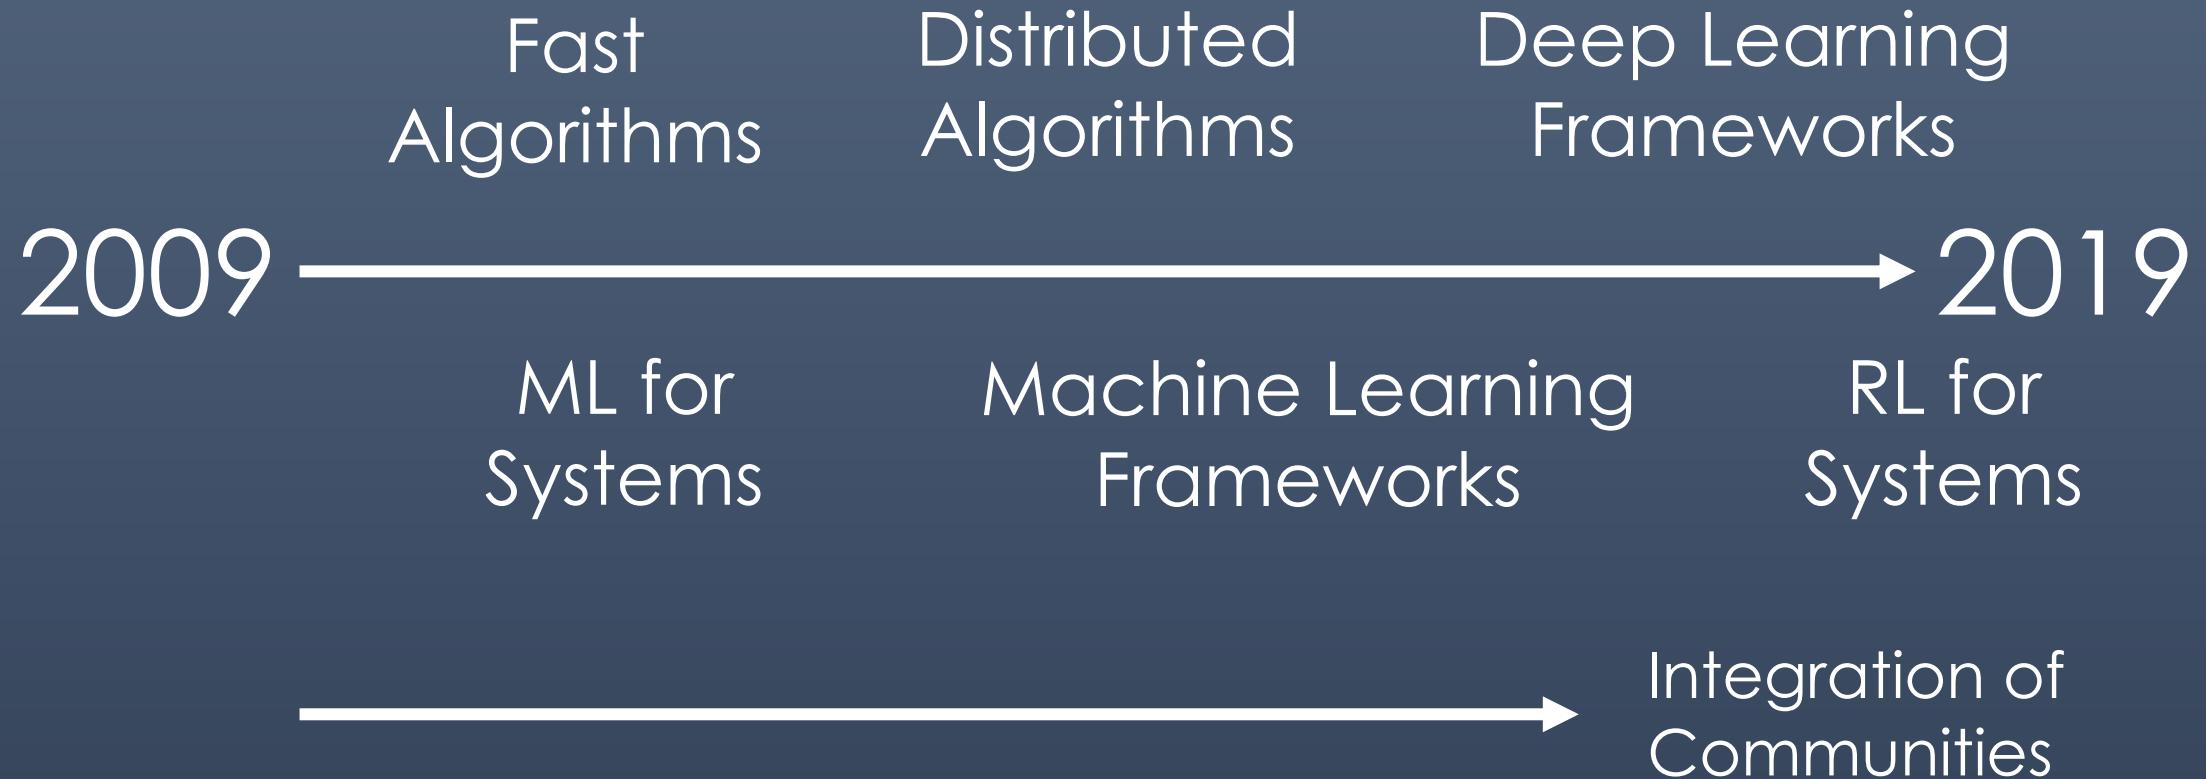

2 blocks from the Marriott Marquis Hotel, (between 41st and 42nd streets on 8th Avenue)

Overview

This workshop is a follow up to the ICML audience of the well attended Learning Systems workshop at NIPS 2015 and the Software Engineering for Machine Learning workshop at NIPS 2013.

A new area is emerging at the intersection of machine learning (ML) and systems design. This birth is driven by the explosive growth of diverse applications of ML in production, the continued growth in data volume, and the complexity of large-scale learning systems. The goal of this workshop is to bring together experts working at the crossroads of ML, system design and software engineering to explore the challenges faced when building practical large-scale machine learning systems. In particular, we aim to elicit new connections among these diverse fields, identify tools, best practices and design principles. The workshop will cover ML and AI platforms and algorithm toolkits (Caffe, Tensor Flow, Torch etc), as well as dive into Machine learning focused developments in distributed learning platforms, programming languages, data structures and general purpose GPU programming.

# Machine learning community has had an evolving focus on AI Systems

# Systems and the Third Wave of AI

# Waves of AI Research

- **1950 to 1974: Birth of AI**
  - 1950 Alan Turing publishes the *Imitation Game*
  - 1951 Marvin Minsky builds first neural network machine (SNARC)
  - DARPA starts to pour money into AI Research (limited oversight)
  - **Incredible optimism**
    - “Within ten years a digital computer will be the world’s chess champion”  
-- Herbert A. Simon and Allen Newell (1958)
    - “In from three to eight years we will have a machine with the general intelligence of an average human being”  
– Marvin Minksy (1970)

# Waves of AI Research

**1950 to 1974:** *Birth of AI*

**1974 to 1980:** *First AI Winter*

- Technology was unable to meet the high expectations
  - **Insufficient computer power**
  - Over emphasis on combinatorial search
  - Insufficient knowledge (data)
- 1969 Book “Perceptrons” by Minsky and Papert
  - Showed that certain basic functions (e.g., parity) cannot be computed using local connections
  - Strong argument against connectionist approaches to AI (neural networks)
- Government funding dries
  - Not meeting objectives
  - DARPA focuses more on immediate impact

# Waves of AI Research

- **1950 to 1974:** Birth of AI
- **1974 to 1980:** First AI Winter
- **1980 to 1987:** Second Wave of AI
  - Expert systems start to solve real-world problems
    - CMU developed XCON (AI for Systems) for DEC → saves \$40M annually
    - Combines “knowledge” (expert rules “data”) with logic
  - Japanese government invests \$850M in AI Research
    - Other governments respond by also investing heavily
  - Emergence of the **AI hardware** and **software industry** to

# Waves of AI Research

**1950 to 1974:** *Birth of AI*

**1974 to 1980:** *First AI Winter*

**1980 to 1987:** *Second Wave of AI*

**1987 to 1993:** *Second AI Winter*

- Expert systems too brittle to maintain
- Collapse of the specialized **AI hardware market**
  - Commodity hardware was improving too rapidly
  - Ultimately over 300 AI companies would vanish from the market
- Massive government funding cuts

# Waves of AI Research

- **1950 to 1974:** Birth of AI
- **1974 to 1980:** First AI Winter
- **1980 to 1987:** Second Wave of AI
- **1987 to 1993:** Second AI Winter
- **1993 to 2011:** AI Goes Stealth Mode (aka Machine Learning)
  - Hardware becomes fast enough, and AI techniques start to work
    - Deep Blue beats Garry Kasparov (1997)
    - OCR, Speech Recognition, Google Search, ...
  - Confluence of ideas and techniques: optimization, statistics, probability theory, and information theory

What is  
ML/AI Systems Research  
Today?

# What is AI-Systems Research?

- Good AI and Systems research
  - Provides insights to both communities
- Leverages understanding of both domains
  - Examples:
    - Studies tradeoff between statistical and computational efficiency
    - Identify essential abstractions in DNN design
    - Leverages framing of indexes to exploit overfitting
- More than just great software!
- Builds on Big Ideas in AI and Systems Research

# Big Ideas in Systems Research

- Problem Framing
  - Identifying the right problem and solution requirements
- Abstraction & Managing Complexity
  - Reducing complex problems into smaller parts
- Tradeoffs
  - Understanding fundamental constraints
- Details: System design and Implementation

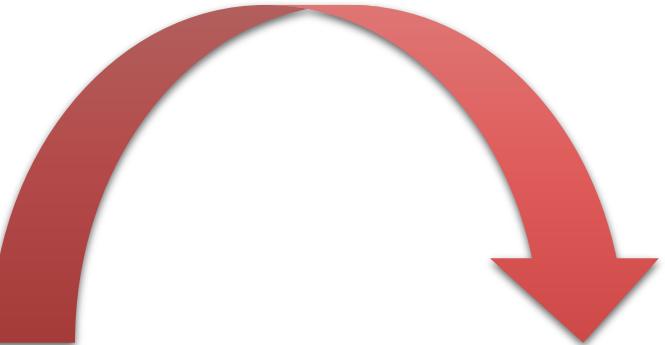

# Big Ideas in ML Research

- Generalization
  - What is being “learned”?
- Inductive Biases and Representations
  - What assumptions about domain enable efficient learning?
- Efficiency (Data and Computation)
  - How much data and time are needed to learn?
- Details: Objectives/Models/Algorithms

# Kinds of AI-Systems Research

Advances in **AI** are being used to address fundamental challenges in **systems**.

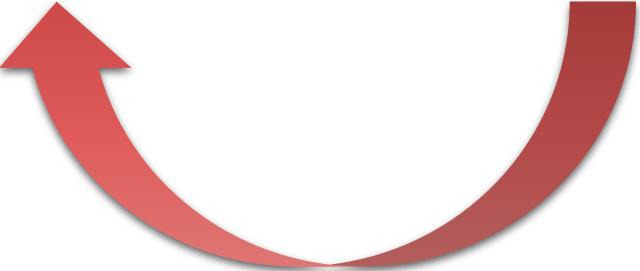

# AI + Systems

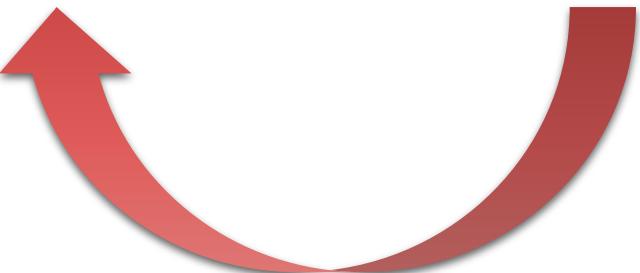

- Reinforcement Learning for
  - Pandas code generation
  - SQL join planning
  - Network packet classification
  - Autoscaling
- Bandit Algorithms for radio link adaptation
- Wireless link quality estimation
- Multi-task learning for straggler mitigation
- VM Selection using Trees ..

# AI + Systems

Advances in **systems** are enabling substantial progress in **AI**

# AI + Systems

## Developing Systems for:

- Autonomous Vehicles
- Reinforcement Learning
- Secure Machine Learning
- Prediction Serving
- Experiment Management

## Advancing AI

- Dynamic Neural Nets
- Prediction on Compressed Data
- Distributed Training
- Distributed Auto-ML

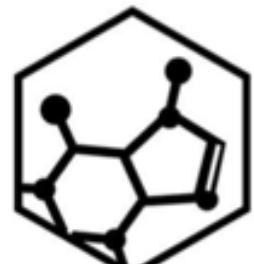

Berkeley is the place to be for

# AI + Systems Research

Why?

# AI + Systems Research

Caffe

About You?

# Background Requirements

- You have taken **previous courses** in either
  - Systems (for example CS162) → comfortable **building systems** and familiar with **big ideas in system design**
  - Machine Learning (for example CS189) → comfortable **training neural networks** and familiar with **big ideas in ML**
- You are **actively involved in research** in either systems or machine learning (or both)

If this does not describe you, please visit my office hours on **Wednesdays from 4-5 in 773 Soda Hall**.

# Goals for the Class

What do you expect from this class?

# My Goals for the Class

- Identify and **solve impactful problems** at the intersection of AI and Systems
- Learn about the big ideas and key results in AI systems
- Learn how to read, evaluate, and peer review papers
- Learn how to write papers that get high review scores

# How will we achieve these goals?

- **Lectures and Reading:** study developments in AI Systems
  - Identify the key open problems and research opportunities
- **Projects:** collaboration between Systems and AI students
  - Explore open problems and produce top tier publications
- **In Class Reviews:** weekly oral reviews of papers
  - Learn both how to evaluate papers and understand how papers are reviewed

# Reasons not to take this class ... 😞

- If you want to learn how to **train models** and **use TensorFlow, PyTorch, and SkLearn**
  - Take: CS C100, CS182, CS189
- If you want learn how to **use big data systems**
  - Take: CS162, CS186
- You are not interested in learning how to **evaluate, conduct, and communicate** research
  - Why not?
- You are **unable to attend lecture**

If you plan to drop  
this class, please drop  
it soon so others can  
enroll!

# Problems

What makes a good problem?

# What makes a **good problem**?

- **Impact:** People care about the solution
  - ... and progress advances our understanding (**research**)
- **Metrics:** You know when you have succeeded
  - Can you **measure progress** on the solution?
- **Divisible:** The problem can be divided into smaller problems
  - You can identify the first sub-problem.
- **Your Edge:** Why is it a good problem **for you?**
  - Leverage your strengths and imagine a new path.

# Can you Solve a Solved Problem?

- Ideally you want to solve a **new** and **important** problem
- A **new solution** to a solved problem can be impactful if:
  - It supports a **broader set of applications** (users)
  - It **reveals a fundamental trade-off** or
  - Provides a **deeper understanding** of the problem space
  - **10x Better?**
    - Often publishable...
    - Should satisfy one of the three above conditions.

# Class Organization

I may make changes to topics and format based on class participation.

# Weekly Topic Organization

- Each week we will cover a new topic
  - Big Ideas in ML/Sys
  - ML Life-cycle
  - ML in DBs
  - Model Dev. Frameworks
  - Distributed Training
  - Prediction Serving
  - Autonomous Driving
  - Model Compilation
  - Hardware Acceleration
  - ML → Systems
  - Secure ML
  - Debugging and Interpretability
- There will be **3 required papers** to read each week
- **Monday** I will cover the background for the topic and an overview of the reading for the week
- **Friday** you will participate in an in class “Program Committee Meeting” to discuss the reading

# In Class PC Meeting Format (V.0)

For each of the three papers: (30 Minutes per paper)

- **Neutral:** recap of the paper (neutral opinion) [5 Minutes]
- **Advocate:** Strengths of the paper [5 Minutes]
- **Critic:** Weaknesses of the paper [5 Minutes]
- Class will discuss **rebuttal** and **improvements** [10 Minutes]
- Brief in-class vote for acceptance into the AI-Sys prelim

# The **Neutral** Presenter will Summarize

- What is the **problem** being solved?
- What was the **solution**? (Summary!)
- What **metrics** did they use to evaluate their solution?
  - What was the **Baselines** of comparison?
- What was the **key insight** or **enabling idea**?
- What are the **claimed technical contributions**?

# Advocate and Critic Will Discuss

- **Novelty and Impact**
  - Are the problem and solution novel and how will the solution affect future research?
- **Technical Qualities**
  - Are the problem **framing** and **assumptions** reasonable
  - Discuss merits of the technical **contributions**
  - Does the **evaluation** support claims and reveal limitations of the proposed approach?
- **Presentation**
  - Discuss the **writing clarity** and **presentation of results**
  - Positioning of **related work**

# Simple Grading Policy

## 20% Class Participation

- **Attend lecture** and **participate** in class discussions
- **Lead 2 to 3 in class** discussions

## 20% Weekly Reviews

- Submit 3 weekly paper reviews (google form) per week!
- Time consuming but important!

## 60% Class Projects

- Do great research!

# Action Items

- Go to website:  
<https://ucbrise.github.io/cs294-ai-sys-fa19/>
- Make sure you are on the course Piazza
  - Needed for announcements
- Signup for **3 discussion slots as different roles here:**

<https://tinyurl.com/aisysfa19signup>
